The Origins of Turtle Soup

The true authorship of Turtle Soup has been a topic of debate; however, it is without doubt that the author is Linda Raschke.

The Turtle Soup Trading Strategy, created by Linda Raschke, was introduced in her book "Street Smarts: High Probability Short-Term Trading Strategies," published in the 1980s. The strategy is named after the famous Turtle Traders, a group trained by commodity trader Richard Dennis in the 1980s. Unlike the original trend-following systems of the Turtle Traders, the Turtle Soup strategy is a counter-trend method that exploits failed breakouts.

More recently, ICT (Inner Circle Trader) has discussed the Turtle Soup theory as part of his trading approach. This method capitalizes on false breakouts, where the price briefly breaches a significant support or resistance level before reversing direction. According to ICT, the Turtle Soup strategy targets these "fakeouts," where traders are lured into a breakout trade only to see the price reverse sharply. This contrarian strategy aims to profit from what ICT refers to as "run on stops," which occurs when traders, who entered positions based on the breakout, are forced to exit as the price moves against them.

Since then, @Romeotpt has shed new light on the Turtle Soup strategy, developing multiple profitable models based on it. By simplifying ICT's concepts and delving into the strategy in depth, Romeo has significantly contributed to the growth and popularity of Turtle Soup.

I'm not here to sell you anything. I am here to teach you how the Algorithm works.

Turtle Soup Core Concepts

TS Core Concept:

The fundamental theory and concept of Turtle Soup can be summarized as "Every Turtle Soup has a Swing Failure."

This concept suggests that Turtle Soup means Fake Breakout or it can also be called a Raid on Stops or Stop Hunt.

Turtle Soup misleads retail traders with false breakouts at highs and lows, and it traps so-called SMC traders by creating deceptive CHOCH signals.

The idea of TS is to Buy the Lows and Sell the Highs.

It will place a failure swing in HTF PDA. After Collecting liquidity, the market reverses from the HTF PDA.

Turtle Soup will start and end the Price Delivery.

More About Turtle Soup

Price movements primarily occur for two main reasons:

- To balance an imbalance.
- To hunt liquidity.

Once liquidity is captured, the price then moves to target the liquidity on the opposite side, a behavior known as the Turtle Soup pattern.

Turtle Soup is higher probability when aligned with the correct Time. (1, 3, 6, 9)

Turtle Soup is not only limited to Highs/Lows, we can anticipate TS on LTF inside a HTF PD Array also.

High Probability Turtle Soup will not give you a retracement entry.

We don't need a Market Structure Shift to confirm Turtle Soup. CISD and iFVG are PD Arrays I personally use to confirm TS.

High probability HTF PD Arrays for LTF TS are FVG | OrderBlocks | Highs/Lows in accordance with your overall context. Look for EQL/EQH that is near a HTF PD Array.

Time > Price.

How To Trade With Turtle Soup

There are certain steps to check for before using Turtle Soup:

- Higher Timeframe Order Flow
- Higher timeframe DOL Level
- Internal Range Liquidity Level
- LTF STRUCTURE SHIFT

After this you must mark out the recent Internal Range Liquidity in the opposite direction of higher time frame order flow and this will be your Target.

Turtle Soup will raid the stops on LTF and most of the time it will tap into a PD array like an FVG on the HTF.

Utilizing TS within CRT Effectively:

The effective way to utilize CRT for identifying trade ideas is by integrating it with TSQ (The Sequence) and Turtle Soup.

High-probability purges are frequently observed at 1 AM EST, 3 AM EST, 6 AM EST, and 9 AM EST. Identifying these timings empowers traders to sift out less reliable purges.

For anyone unfamiliar with TSQ, it stands for The Sequence. This represents a method to trade Higher Timeframe CRT Ranges on lower timeframes using specific protocols.

TSQ consists of various phases, offering both reversal and multiple continuation entries within a higher timeframe CRT setup.

The phases of TSQ include:

- CRT Turtle Soup
- CSD (Change in State of Delivery)
- OTE (Optimal Trade Entry)
- Continuation
- KOD (Kiss of Death)
- CRT Opposing Turtle Soup
